

E422

msv
330 fine laminae
15 mm
↳ 0.5 mm relief = 10 mm; disturbed top to fine laminated unit

largely msv unit w/ some gels visible:
interp. extensively bioturbated
As 3 Ld 1 Ag + (bioturbation zone above horizon of lake turnover)

E432

E435

DE(9)

E438

base

340 1 mm relief = 8 mm
6.0 190s, 53% si, 46% cl
ms Ag + Ld fine laminated unit - top of unit is bioturbated
mlgc

↳ 0.5 mm
8% S, 41% si, 51% cl

gcl 9.5
gcl

Why no coarse contact?

d1 2 mm

horizontal cut

What does this mean? A "shallow" facies?

ARN 96-08 349 cm
1 cm thick slice of B seg 3 core Y
2H, 1B, 1I, 1R, 5, N (B)
3790 ± 90 BP -28.8%
AA-20168 11.4 mg

4.6 laminated unit
190s, 40% si, 59% cl

As 3 Ag 1

E447

360 1.5 + 2.0 mm
msv, extensively burrowed

2 mm top of laminated unit disturbed by burrowing
fine laminated unit 4f-c-d.

Clast(?) of msv gel-like material that intruded sideways into a fine Ld 3-As 1 unit. - Did this occur during a lake turnover? maybe

mlgc fine laminated unit As 3-Ld 1 Ag +

370 5.7 49% S, 42% si, 54% cl
Ld 2 + As 1 + Ag +

gcl finer gel, no track

d1 transcribed over 2 mm

d1 relatively coarse gel plus fine track Ld 2 + As 1 Ga + Dg +

DE # 22

[0.4 mm clast 5 mm x 15 mm near top of sand at 376.5 cm]

sd Ga 90% fine sand, no upward gradation, no evidence of pulses

380 <0.5 mm 99% sand, 1% silt + clay

MAJOR EROSIONAL UNCONFO
↳ pocket of sand, burrow?

joint lamination
(largely bioturbated?)

As 3 Ag 1 Ld +

390 1 mm

clean lamination - evidence of burrows

As 3 Ag 1 Ld 1 -
